

# The

# Language

## Introduction to C language

# The Language

\* Made By Dennis Ritchie in 1970s.

\* It is used to make games.

Because it is very fast language.

Programs run very fastly. in C Language.

In this Course we learn from basic to Advance

Basic  Advance

# The Language

---

In this video we write our first code

```
#include <stdio.h>
```

```
int main()
```

```
{
```

```
    printf("Hello World\n");
```

```
    return 0;
```

```
}
```

# The

# Language

## Basic Structure of C Language

# The Language

```
main.c
1  #include <stdio.h>
2
3  int main()
4  {
5      printf("Hello World");
6
7      return 0;
8  }
9

Hello World

...Program finished with exit code 0
Press ENTER to exit console.
```

# The Language

In any C program

Preprocessor command, functions, variables, statements, expressions, comments.

`#include <stdio.h>` → preprocessor command  
File  
`int main()` → function  
function → break down a program into parts  
`printf("Hello World\n");` → function  
for this  
`return 0;` → give integer value to operating system

# The

# Language

## Basic Syntax of C Language

# The Language

```
main.c
1  #include <stdio.h>
2
3  int main()
4  {
5      printf("Hello World");
6
7      return 0;
8  }
9

Hello World

...Program finished with exit code 0
Press ENTER to exit console.
```

# The Language

Any C program is made with

Constant, identifiers, string literal, symbol, keyword  
are Tokens.

Tokens of  
printf("Hello World \n")

are

printf

("Hello World \n")

);

(;) semicolon is used to terminate program

# The Language

main.c

```
1  #include <stdio.h>
2
3  int main()
4  {
5      printf
6      (
7          "Hello World\n"
8      )
9      ;
10
11     return 0;
12 }
13
```

# The Language

---

Key words → reserved words of C programming  
There are 32 general purpose keyword  
you can't make <sup>their</sup> constant, identifier, variable.

Key word → int, return

identifiers → name of variable or function  
A-Z, a-z, -, letters, numbers

@, \$, %	Punctuation characters	C not allowed as identifiers
----------	------------------------	------------------------------

# The Language

---

<code>auto</code>	<code>double</code>	<code>int</code>	<code>struct</code>
<code>break</code>	<code>else</code>	<code>long</code>	<code>switch</code>
<code>case</code>	<code>enum</code>	<code>register</code>	<code>typedef</code>
<code>char</code>	<code>extern</code>	<code>return</code>	<code>union</code>
<code>const</code>	<code>float</code>	<code>short</code>	<code>unsigned</code>
<code>continue</code>	<code>for</code>	<code>signed</code>	<code>void</code>
<code>default</code>	<code>goto</code>	<code>sizeof</code>	<code>volatile</code>
<code>do</code>	<code>if</code>	<code>static</code>	<code>while</code>

# The Language

This is very case sensitive programming language

Variable

$h \rightarrow$  1st variable

$H \rightarrow$  2nd variable

Symbol  $\rightarrow$  &, %, +, -, etc.

comments  $\rightarrow$  //,  
/\*

min. one white space character

In our program

int, return  $\rightarrow$  key word

printf, main  $\rightarrow$  function

0  $\rightarrow$  constant

"Hello World\n"  $\rightarrow$  string literal

# The

# Language

## **Variables and Data types in C Language**

# The Language

---

## Variables in C

\* A name given to a memory location.

\* Declared by writing type variable name;

ex. `int a;`

`int a, b;`

\* Initialized and declared by

`type variable name = value;`

ex. `int a = 4;`

`int a = 4, b = 6;`

# The Language

---

## Rules for defining a Variable in C Language

- Can contain alphabets, digits and underscore(\_).
- A variable name can start with an alphabet and underscore only.
- Can't start with a digit.
- No whitespace and reserved keywords are allowed.
- Valid Variables:  
`int harshit, float harshit123, char _harshit34.`
- Invalid Variables: `int 77harshit, float $harshit,`  
`char long; int harshititharsh.`

# The Language

---

<code>auto</code>	<code>double</code>	<code>int</code>	<code>struct</code>
<code>break</code>	<code>else</code>	<code>long</code>	<code>switch</code>
<code>case</code>	<code>enum</code>	<code>register</code>	<code>typedef</code>
<code>char</code>	<code>extern</code>	<code>return</code>	<code>union</code>
<code>const</code>	<code>float</code>	<code>short</code>	<code>unsigned</code>
<code>continue</code>	<code>for</code>	<code>signed</code>	<code>void</code>
<code>default</code>	<code>goto</code>	<code>sizeof</code>	<code>volatile</code>
<code>do</code>	<code>if</code>	<code>static</code>	<code>while</code>

# The Language

---

## Data Types in C

- \* Basic Data Type: int, char, float, double
- \* Derived Data Type: array, pointer, structure, union
- \* Enumeration Data Type: enum
- \* Void Data Type: void

# The

# Language

## Operators in C Language

# The Language

---

## Operators In C

- \* An operator is a symbol used to perform operations in giving programming language.
- \* In this tutorial series, we will look into operators used in C Language.

# The Language

---

## Types of Operators in C Language

\* Arithmetic Operators

\* Relational Operators

\* Logical Operators

\* Bitwise Operators

\* Assignment Operators

# The Language

---

## ▷ Arithmetic Operators

+

Addition

-

Subtraction

\*

Multiplication

/

Division

%

Modulus

# The Language

---

## ▷ Relational Operators

`==`

Is equal to

`!=`

Is not equal to

`>`

Greater than

`<`

Less than

`>=`

Greater than or equal to

`<=`

Less than or equal to

# The Language

---

## ▷ Logical Operators

&&

And operator

Both true then true

||

OR operator

Any one true then true

!

NOT operator

Reverse the logical statement

# The Language

## ▷ Bitwise Operators

X	Y	X&Y	X Y	X^Y	~(X)
0	0	0	0	0	1
0	1	0	1	1	1
1	0	0	1	1	0
1	1	1	1	0	0

~ one's complement operators

<< left shift operator

>> right shift operators

# The Language

---

## ▷ Assignment Operators

=

right side value equal to left side

+=

Add AND assignment operator

-=

Subtract AND assignment operator

\*=

Multiply AND assignment operator

/=

Divide AND assignment operator

# The Language

---

## ▷ Miscellaneous Operators

sizeof()

Returns the size of variable

&

Return the address of a variable

\*

Pointer to a Variable

?:

Conditional Expression

# The

# Language

## **Format Specifier & Comments in C Language**

# The Language

---

## Format Specifier

- \* Format specifier is a way to tell compiler what type of data is in a variable during taking input and display output to the user.
- \* `printf("%a.bf", var);` will print 'var' with 'b' decimal points in a 'a' character space

# The Language

---

Format Specifier	Data Type
%f	float
%d	int
%c	char
%l	long
%lf	double
%Lf	long double

# The Language

---

## Comments

// → *Single Line comment*

/\*  
→ *Multi-line comment*  
\*/

# The

# Language

## Escape Sequences and Constants in C Language

# The Language

---

## Escape Sequences in C

- \* An escape sequence in C programming is a sequence of characters.
- \* It doesn't represent itself when used in character or string literal.
- \* It is composed of two or more characters starting with backslash \. For example: \n represents new line.

# The Language

---

Escape Sequence	Meaning
<code>\n</code>	New Line
<code>\t</code>	Horizontal Tab
<code>\b</code>	BackSpace
<code>\r</code>	Carriage Return
<code>\a</code>	Audible bell
<code>\'</code>	Printing single quotation
<code>\"</code>	printing double quotation
<code>\?</code>	Question Mark Sequence
<code>\\</code>	Back Slash
<code>\f</code>	Form Feed
<code>\v</code>	Vertical Tab
<code>\0</code>	Null Value
<code>\nnn</code>	Print octal value
<code>\xhh</code>	Print Hexadecimal value

# The C Language

---

## Constant in C

- \* Value or Variable that can't be changed in the program,  
Ex. 17, 23, 'a', 3.47, "Coding Version".
- \* Ways to define constant in C programming
  - const keyword
  - #define preprocessor

# The

# Language

## Exercise 1 : Multiplication Table

# The Language

```
Enter a number you want table of
```

```
31
```

```
Table of 31
```

```
31x1=31
```

```
31x2=62
```

```
31x3=93
```

```
31x4=124
```

```
31x5=155
```

```
31x6=186
```

```
31x7=217
```

```
31x8=248
```

```
31x9=279
```

```
31x10=310
```

```
...Program finished with exit code 0
```

```
Press ENTER to exit console.█
```

# The

# Language

## Exercise 1 : Multiplication Table Solution

# The Language

```
Enter a number you want table of
```

```
31
```

```
Table of 31
```

```
31x1=31
```

```
31x2=62
```

```
31x3=93
```

```
31x4=124
```

```
31x5=155
```

```
31x6=186
```

```
31x7=217
```

```
31x8=248
```

```
31x9=279
```

```
31x10=310
```

```
...Program finished with exit code 0
```

```
Press ENTER to exit console.█
```

## If – Else Statement in C Language

# The Language

## If - Else statements in C

- \* It is a control statement.
- \* It is used to perform operations based on some conditions

→ Types of statements

- > if statement
- > if else statement
- > if - else if ladder

Syntax for if else

```
if (3 < 10) {  
    printf("This will execute");  
}
```

# The Language

Flowchart for if statement

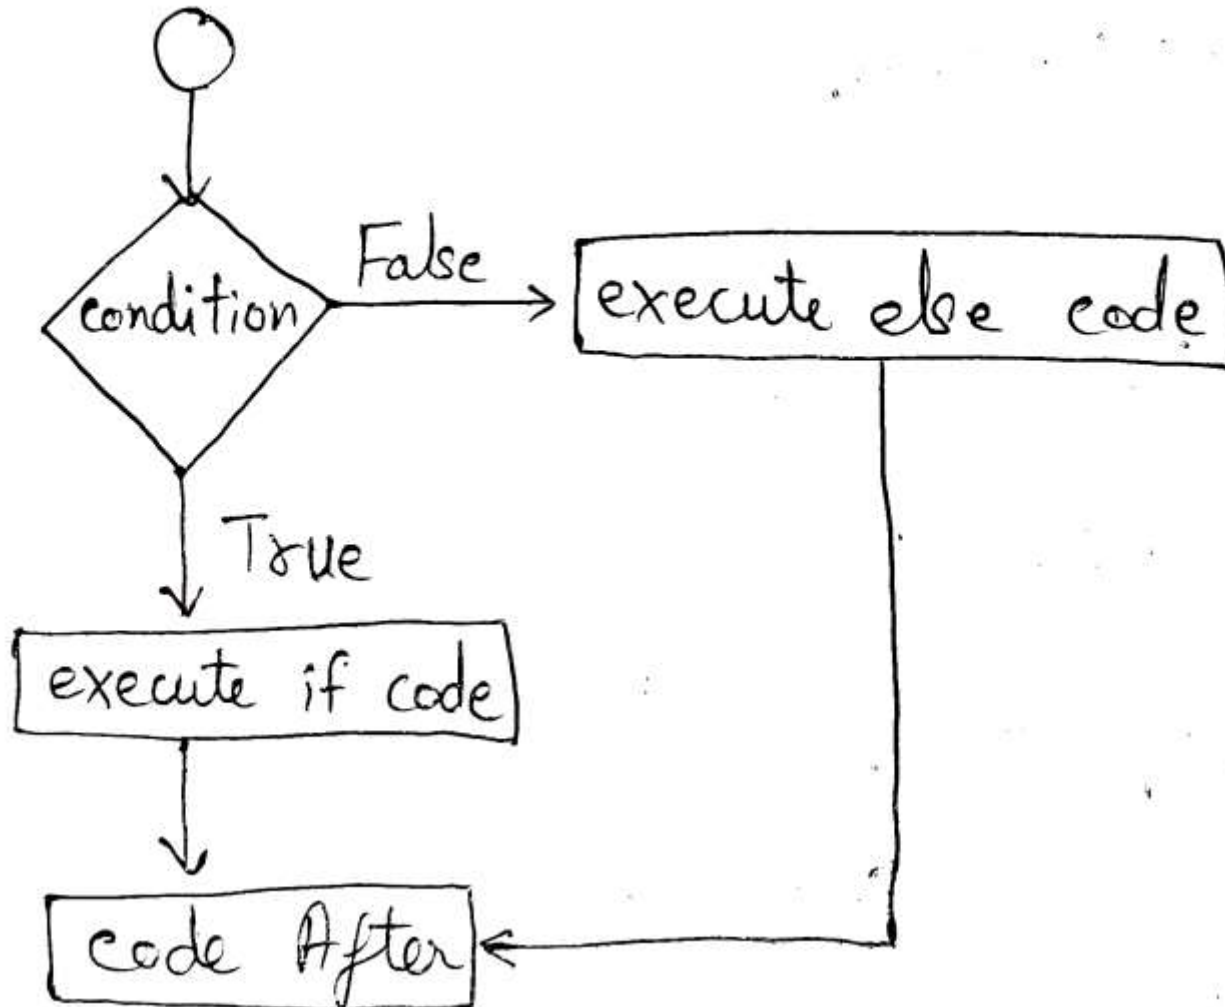

Syntax  
if (condition) {  
    code  
}

# The Language

Flowchart for if-else statement

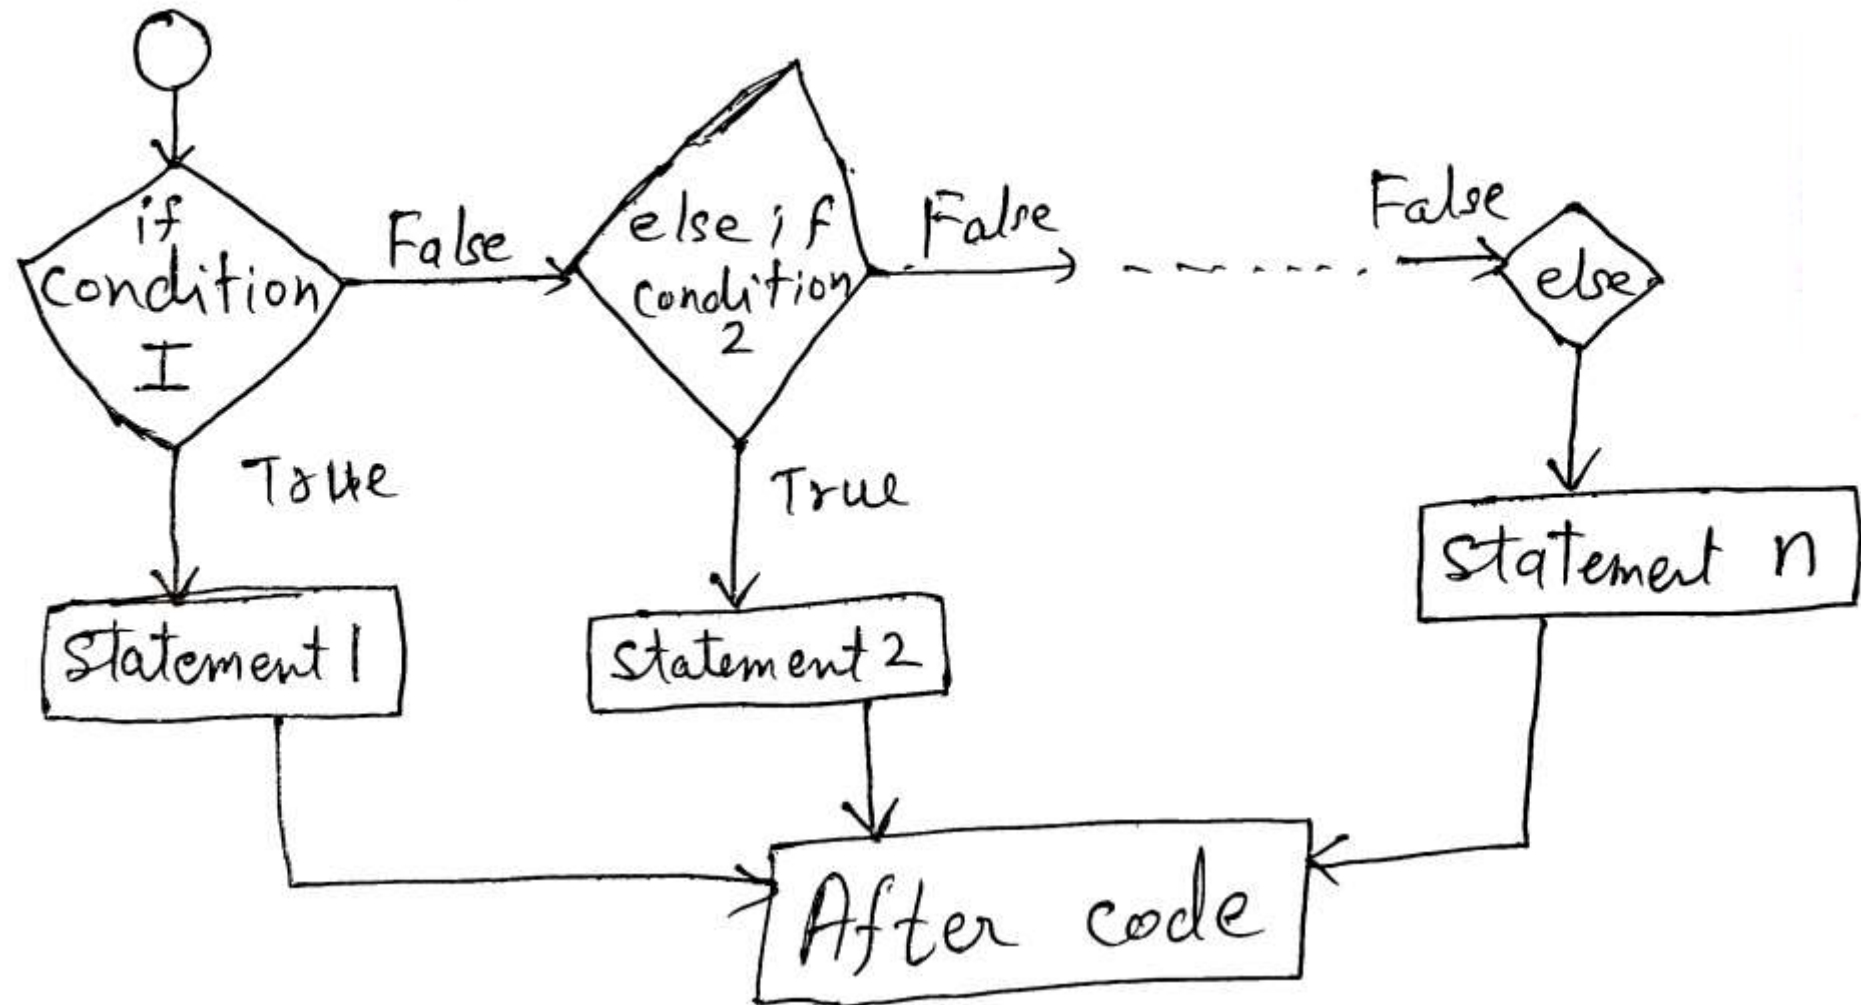

Syntax  
if (condition) {  
    code (True) }  
else {  
    code (False) }

# The Language

Flowchart for if - else if ladder

# The Language

---

Syntax

```
if (condition 1) {  
    code 1  
}  
else if (condition 2) {  
    code 2  
}  
...  
else {  
    code n  
}
```

# The

# Language

## Switch Case Statement in C Language

# The Language

---

## Switch Case Statements in C

```
int a = 2;  
switch(a) {  
    case 2:  
        printf("Value is 2");  
        break;  
    case 3:  
        printf("value is 2");  
    default:  
        printf("Nothing matched")  
}
```

# The Language

## Rules for Switch Statements

- Switch expression must be an int or char.
- Case value must be an integer or a character.
- Case must come inside switch.
- Break is not a must.

Valid

```
int x;  
Switch(x){  
    // code + case  
}
```

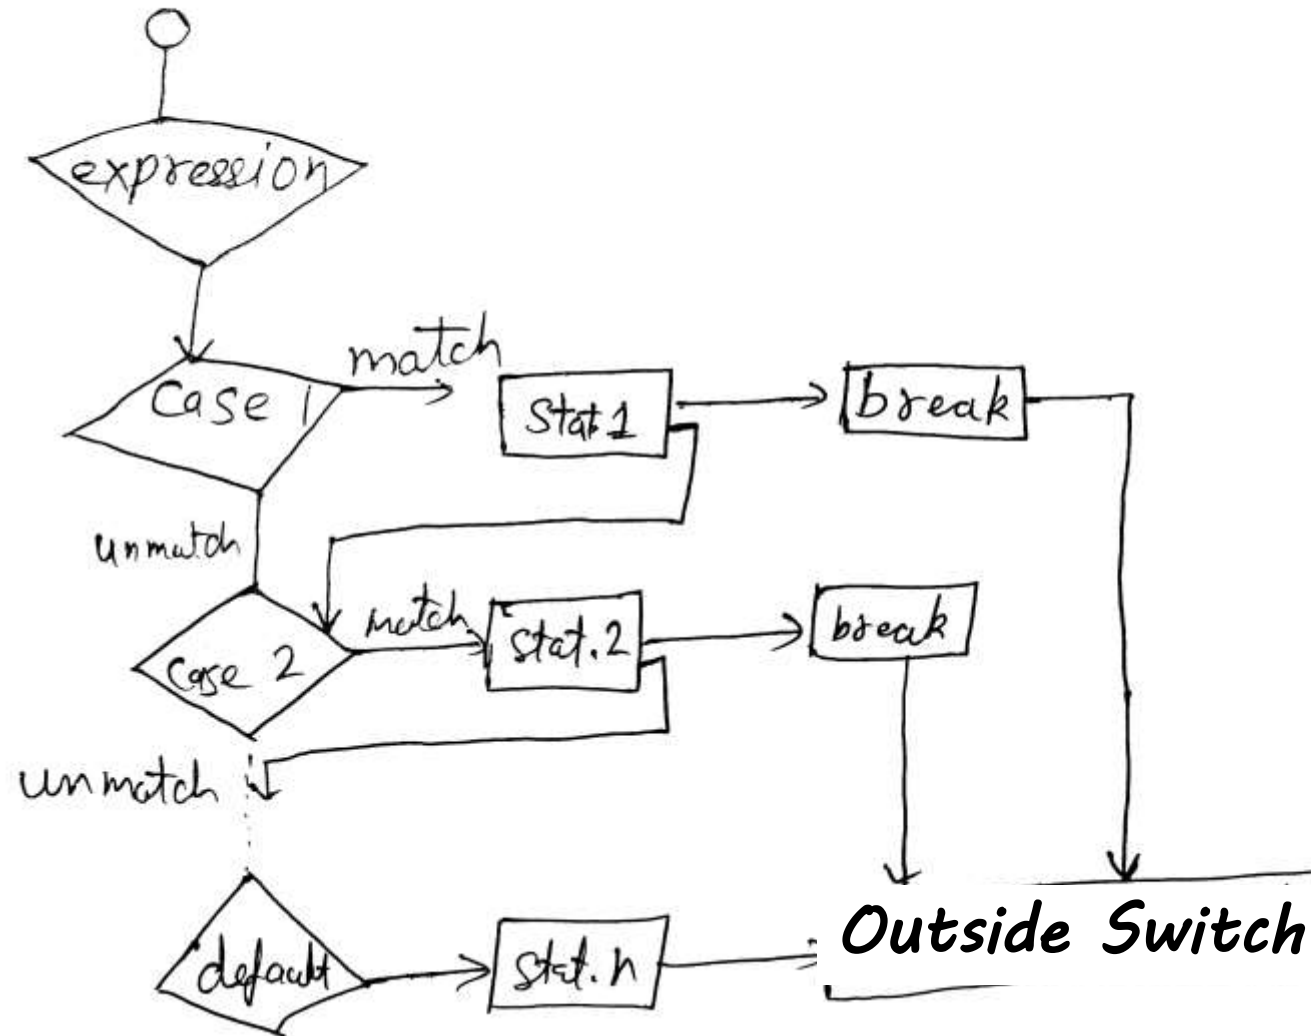

Invalid

```
float x;  
switch(x){  
    // case + code  
}
```

# The Language

Flowchart for Switch case statement

# The

# Language

## Loops in C Language

→ Why do we programming?

- \* Code reusability
- \* making games

→ How loop works?

loop start  $\rightarrow$  check condition  $\xrightarrow{\text{False}}$  exit loop  
 $\downarrow$  True  
 execute loop

# The Language

---

## \* Types of Loops

> do while loop

> while loop

> for loop

# The

# Language

## Do While Loop in C Language

# The Language

---

Do While Loop

do {

// code to be executed

} while (condition)

# The Language

---

Ex.

```
int i = 0
```

```
do {
```

```
    i = i + 1;
```

```
    printf("%d", i);
```

```
} while (i < 10);
```

do while loop executes at least once

# The

# Language

## While Loop in C Language

# The Language

---

## While loop in C Language

```
while (condition)
{ // code to be executed
}
```

Ex.

```
int i=0
while (i<30){
    print ("%d", i);
    i=i+1; }
```

# The Language

Do While Loop

```
do {  
    // code to be executed  
} while (condition)
```

While loop in C Language

```
while (condition)  
{ // code to be executed  
}
```

# The

# Language

## For Loop in C Language

# The Language

---

For loop in C Language

```
For for(Expression 1; Expression 2; Expression 3)
{
    // code to be executed
}
```

# The Language

---

## Properties of Expression 1

- The Expression represents the initialization of the loop variable.
- We can initialize more than one variable in Expression 1
- Expression 1 is optional.

# The C Language

---

## Properties of Expression 2

- It is conditional expression. It checks for a specific condition to be satisfied. If it is not, the loop is terminated.
- It can have more than one condition. However, the loop will iterate until the last condition becomes false. Other conditions will be treated as statements.
- It is optional.

# The Language

---

- Expression 2 can perform the task of expression 1 and expression 3. That is, we can initialize the variable as well as update the loop variable in expression 2 itself.
- We can pass zero or non-zero value in expression 2. However, in C, any non-zero value is true and zero is false by default.

# The Language

---

## Properties of Expression 3

- Expression 3 is used to update the loop variable.
- We can update more than one variable at the same time.
- Expression 3 is optional.

# The

# Language

## **Break & Continue Statement in C Language**

# The Language

---

## Break Statement

- Used to bring the program control out of the loop.
- The break statement is used inside loops or switch statement.
- Break statement can be used with
  - > Loops
  - > Switch case expression

# The Language

---

ex. while (condition){

// user enters his name & keeps  
playing untill game over

if (name == "Satyam"){

break;

} }

# The Language

---

## Continue Statement

- Used to bring program control to the next iteration of the loop
- The continue statement skips some code inside the loop and continues with the next iteration.
- It is mainly used for a condition so that we can skip some lines of code of a particular condition.

# The

# Language

## **GOTO Statement in C Language**

# The Language

---

## GOTO

## Statement

- Also called jump statement in C Language.
- Used to transfer program control to a predefined label.
- It's use is avoided since it causes confusion for the fellow programmers in understanding the code.
- GOTO statement is preferable when we need to break multiple loops using single statement at the same time.

# The

# Language

## **Typecasting in C Language**

# The

# Language

## Typecastin

- It is used to convert Data Type.
- Change the data type of the output.

### Syntax

(data type)

value;
